Year: 2025 – 26

Subject: FSDL

Name of the Student: Manasvi Patil

PRN: 124B2B027

Branch: Computer Engineering

Division: C

Assignment No 5

Title : Create a simple functional college website / travel agency website / insurance website using Node.js and Express using any NoSQL data set like MongoDB if required.

Objectives:

- To understand the structure of a dynamic web application using Node.js and Express
- To learn how HTML is used to design web pages and form-based user interfaces
- To apply CSS and Bootstrap for responsive and attractive UI design
- To use JavaScript for client-side validation and interaction
- To connect the application with MongoDB (NoSQL database) for storing and retrieving data
- To design a simple full-stack web application for managing user information or bookings

Outcomes:

- Develop a functional web application using Node.js and Express framework
- Create responsive web pages using HTML, CSS and Bootstrap
- Store and manage application data using MongoDB database
- Implement forms to collect user information such as bookings or inquiries
- Understand the basic workflow of full-stack web development

Theory :

A Travel Agency Website is a web-based system that allows users to explore travel destinations, view travel packages, and submit booking requests online. Traditionally, travel agencies managed bookings manually through phone calls or office visits. However, with the advancement of web technologies, travel agencies now provide online platforms where users can easily browse packages and make travel inquiries. This project implements a dynamic travel agency website using Node.js, Express, and MongoDB. The frontend of the website is developed using HTML, CSS, and Bootstrap to design attractive pages such as the homepage, travel packages page, and booking form. The backend is implemented using Node.js and Express framework, which processes user requests and handles communication between the website and the database. MongoDB is used as a NoSQL database to store booking information submitted by users. It stores data in JSON-like documents, which makes it easy to manage and retrieve information.

Data Stored in Travel Agency System

The system stores important travel-related information such as:

- Customer name
- Email and contact number
- Selected travel destination
- Travel date
- Number of travelers
- Special requests or additional notes

Role of Backend and Database

When a user fills the travel booking form, the following steps occur:

1. The user enters booking details on the website form.
2. The form data is sent to the Node.js server using HTTP request.
3. The Express framework processes the request.
4. The booking information is stored in MongoDB database.
5. The server sends a confirmation response to the user.

This system simplifies the travel booking process and allows travel agencies to manage customer requests efficiently.

By using Node.js, Express, and MongoDB, developers can build scalable and efficient web applications that handle real-time user interactions and database operations.

Code :

```
<!DOCTYPE html>

Conclusion :

The Travel Agency Website developed using Node.js, Express, and MongoDB provides a simple platform for users to explore travel services and submit booking requests online. The system allows efficient storage and management of customer travel information in a NoSQL database. It demonstrates the integration of frontend technologies with backend server and database. Overall, this project helps in understanding the basics of full-stack web development and dynamic web applications.
